

AIR BREAK

Air break tanks are tanks that are used to avoid water reflux due to pressure drops in the water mains. Control of the water level in the tank can be performed electrically, by micro switches, or mechanically, by a specially provided valve that shuts off the flow of water.

APPLICATIONS

- Vending machines
- Coffee machines
- Ice makers

SPECIAL VERSIONS

There are various versions of Milano Componenti air-break tanks: versions with one or two micro switches and versions with an additional nozzle for quicker filling of the tank. Valve connections can be threaded (1/8 Gas thread) or quick-fit (type JG).
